Description

BTS2048-VL-TEC, CCD spectroradiometer with thermoelectric cooling of the CCD detector

The BTS2048-VL-TEC variant of the [BTS2048-VL](#) incorporates thermoelectric cooling of its CCD detector. The device meets all the requirements of a high-end diode array spectroradiometer and is favourably priced despite its cutting-edge design.

Thermoelectric cooling of the CCD detector minimizes the dark noise signal and enables integration times ranging from 2 μ s to 60 s whereas those of the BTS2048-VL lie between 2 μ s and 4 s. The BTS2048-VL-TEC is therefore ideal for applications with very low light intensities or rarely possible dark signal measurements due to its high stability. It is also ideal for luminous flux measurements in which the integrating sphere connected to the device is significantly heated up by high-power lamps. See also our technical article about [SSL/LED testing](#). The BTS2048-VL-TEC can be easily attached on an integrating sphere. Gigahertz-Optik offers many integrating standard spheres like the perfectly for [LED binning](#) suited [ISD-15-BTS2048-VL](#). We also offer customized solutions to address your needs, see our [Integrating_Sphere_Construction_Kit](#) or other examples in [Integrating_Sphere_Based_Spectroradiometer_Systems](#).

*One of its unique features is the from Gigahertz-Optik developed innovative [BiTec sensor](#) that consists of a V(lambda) filtered Si photodiode and a spectroradiometer unit. This makes it extremely linear, stable, and fast and is therefore a guarantee for higher measurement accuracy which is not accompanied by any disadvantages. Both sensors can be used independently and the mutual correction of the sensors is advantageous for accuracy, speed and versatility (see article on [BTS technology](#)).

From a formal point of view with the CIE 231:2019 and DIN 5032-7:2024 photometers with built-in spectral mismatch correction by spectral measurements are treated the same way as classic photometers. Resulting parameters such as f_1' can be determined in accordance with DIN EN 13032-1, provided that the spectral and integral measurements are performed with the same input optics, which is always the case with our BTS devices. The BTS were already ahead of their time, and standardization has now caught up.

Optimized stray light behavior, especially in the UV range

Precise measurements in the UV require minimal influence from spectral stray light. This goal is achieved in the BTS2048 series through an optimized beam path design. In addition, it is possible to characterize the stray light matrix of the spectroradiometer, thereby further reducing the residual stray light signal. (see technical Article about [stray light suppression](#) for details).

Specifically for the large spectral range from 350 nm to 1050 nm, the BTS2048-VL-2-TEC variant offers not only stray light matrix correction but additionally the use of an out-of-range (OoR) filter for stray light reduction. This measurement method can also be used without a stray light matrix and significantly improves measurement performance in the UV range. The available measuring range can be extended to the range from 280 nm to 1050 nm when required.

User software and developer software

The standard [S-BTS2048](#) user software has a customizable user interface and a large number of display and function modules which can be activated when configuring the BTS2048-VL-TEC with the respective accessory components from Gigahertz Optik GmbH. The [S-SDK-BTS2048](#) developer software is offered for the integration of the BTS2048-VL-TEC in the customer's own software.

Calibration of the BTS2048-VL-TEC

calibration. The BTS2048-VL-TEC is calibrated by Gigahertz-Optik's [ISO/IEC 17025 calibration laboratory](#) that was accredited by DAkkS (D-K-15047-01-00) for the spectral responsivity and spectral irradiance according to ISO/IEC 17025. The calibration also included the corresponding accessory components. Every BTS2048-VL-TEC device is delivered with its respective calibration certificate.

Specifications

General

Short description	High speed TE cooled CCD spectroradiometer with a wide dynamic range for CW and pulsed measurements of irradiance/illuminance, spectrum, luminous color, and color rendering index. Accessories for measurement of other parameters.
Main features	Compact device. BiTec detector with back-thinned TE cooled CCD (2048 pixels, 2 nm optical resolution, electronic shutter) and Si-photodiode with V(lambda) filter. Optical bandwidth correction (CIE214). Filter wheel with shutter and attenuation filters. Input lens with a diffusor window that has a cosine field of view. Automatic PWM synchronization
Measurement range	Spectral: 0.2 lx to 3E8 lx 280 nm to 1050 nm (min. level by white LED with low saturation). Integral: photometric 360 nm to 830 nm, 0.1 lx Noise signal up to 3E8 lx
Typical applications	CCD spectroradiometer for design applications. Module for integration in test systems for front-end and back-end LED binning
Calibration	Factory calibration. Traceable to international calibration standards
